

What WINDI-HIOS Proves / Does Not Prove

One-page technical control boundary · no marketing claims

Purpose: give a technical reviewer a fast, falsifiable boundary between recorded evidence and unsupported conclusions.

WINDI-HIOS can evidence	It does NOT establish by itself
A specific hash was registered	The document content is true
A registration timestamp exists	The document existed before that timestamp
A declared actor/DID is associated with the record	The actor had legal or professional authority
A human approval event was declared/recorded	The human read, understood, or was competent to decide
A later file can be compared by hash	Original authorship or ownership
A receipt/verification path exists	Notarization, legal validity, regulatory compliance
An AI output can be preserved as an artifact	That the AI output is correct or should become a decision

Control rules

Hash ≠ truth. Receipt ≠ authorship. Recorded act ≠ authority. AI recommendation ≠ human decision.

For banking use, ask for additional evidence whenever the conclusion depends on identity assurance, authorization, segregation of duties, source-system provenance, regulatory status, professional sign-off, or business correctness.

Review prompt: “Which additional controls would you require before accepting this evidence inside a bank?”

Status: MEETING HANDOUT · NOT A CERTIFICATION · NOT CANONICAL · NOT SEALED
